X 6. I certify that all moderately and severely limited soils have been removed in an area _____ feet wide or 33% of the area of the drainfield. This area is centered in the drainfield and extends to a depth of _____ feet where slightly limited soils exist. Surveyor must submit 2 plot plans to scale of excavated area. (See diagram B on reverse side) Date Observed: __/__/__

___7. I certify that all severly limited soils have been removed from an area one foot beyond the perimeter of the drainfield rock and the excavation meets all detail requirements as shown in _____ "Diagram A", or _____ "Diagram B" on reverse side. Surveyor must submit 2 plot plans to scale of excavated area. Date Observed: __/__/__

NOTE:
a. Severely limited soil includes but is not limited to hardpan, clay, silt, marl or muck.
b. Drainfield must be centered in the excavated area. Drainfield will not be approved if severe limited soils are not removed.

The methods of determining the wind force generated reaction loads in this document utilizes the provisions of the ANSI / ASCE Standard 7-93, Minimum Design Loads for Buildings and Other Structures, Section 6, Wind Loads, 6.4.2 Analytical Procedure in accordance with 6.4.2.2 *Limitations of Analytical Procedure*. This method applies all appropriate factors and pressure coefficients applicable for the main wind force resisting system, end zones, overhangs, edge strips, walls, roofs, components and cladding as shown in Section 6, figures 1, 2, 3, & 4 and tables 4, 5, 6, 7, 8, 9, 10, 11 & 12. The velocity pressures shown in Step No. 1 have been calculated in accordance with Section 6.5.1 and modified for velocity pressure exposure coefficients and gust response factors relative to exposures C and D in compliance with Table 6 and Table 8 respectively.

The use of this document is restricted to buildings less than 60 feet high, subject to the same limitations as shown in Section 6.4.2.2 of the ASCE Standard 7-93 and must be completed under the direction and supervision of a registered professional engineer.

STEP No. 3 (Cont.) Calculate wind uplift loads for structural roof framing members at both bearing points.

List hip roof king-jacks after Step 4D is completed. Do include hand framed Gables, GF-#.

Note 2: The selection of the coefficient "C" must be from the chart shown on page 1 and is based first on the roof framing center distance, 16" or 24" on center; next the chart for the appropriate roof pitch angle must be used in conjuction with the roof frame member span length from bearing point to bearing point. Follow calculation instructions at the bottom of the columns.

Important: Select the correct coeficient for each roof framing member based on the number of Edge or Ridge strip areas acting on that specific roof frame member. Typically, most hip jacks and some rafters have only one edge or ridge strip.

The load result of this calculation is the net uplift reaction vertical to the bearing point less the dead load reaction.

STEP No. 2 — **Identify and Number:**

Note: Nomenclature assigned by truss companies may also be used except for girders & beams.

SAMPLE: A-T1 (A = the roof Rectangle in which the truss T1 is located)

On your roof framing plan, identify, by prefixes and number, all structural framing members.

Use the same prefix and number for all members which are identical in span and general design.

Prefixes are shown in the chart below.

Note: Mark all girder trusses and beams at their bearing points with "A" at one bearing point and "B" at the other bearing point. (Example: G1-A and G1-B for each end of a girder truss)

Item Description →	Roof Truss	Roof Rafter	Hip Jack	Beam or Girder	Hip King Jack	O.S.Roof Corner	Opening Header	Gable Frame	Shear Wall (Int.)	End Wall	Side Wall
Rectangle Prefix +	T-#	R-#	J-#	B or G-#	K-#	CR-#	H-#	GF-#	X-#	EW-#	SW-#

STEP No. 3 — **Calculate wind uplift loads for structural roof framing members at both bearing points.**

List hip roof king-jacks after Step 4D is completed. Do include hand framed Gables, GF-#.

Note 2: The selection of the coefficient "C" must be from the chart shown on page 1 and is based first on the roof framing center distance, 16" or 24" on center; next the chart for the appropriate roof pitch angle must be used in conjuction with the roof frame member span length from bearing point to bearing point.

Follow calculation instructions at the bottom of the columns.

Important: Select the correct coeficient for each roof framing member based on the number of Edge or Ridge strip areas acting on that specific roof frame member. Typically, most hip jacks and some rafters have only one edge or ridge strip.

The load result of this calculation is the net uplift reaction vertical to the bearing point less the dead load reaction.

State Approved Equipment Tie Down - FL14239

On March 23rd 2012 the governor signed HB 704 amending SECTION 16 of the 2010 FBC to the 2007 FBC. See the copy below.

HB 704 – Relating to the Florida Building Commission and the Florida Building Code

Chapter Law Number: Chapter No. 2012-1
Approved by the Governor 3/23/2012

Section 16

4) Notwithstanding the provisions of this section, exposed mechanical equipment or appliances fastened to a roof or installed on the ground in compliance with the code using rated stands, platforms, curbs, slabs, or other means are deemed to comply with the wind resistance requirements of the 2007 Florida Building Code, as amended. Further support or enclosure of such mechanical equipment or appliances is not required by a state or local official having authority to enforce the Florida Building Code. This subsection expires on the effective date of the 2013 ~~2010~~ Florida Building Code.

The following files from www.floridabuilding.org Code Version 2007, number FL 14239, contain the necessary compliance information for tie down clip approval. The specific information required by building departments may vary. Consult with the individual building department for what portion of the following information is needed for permit approval.

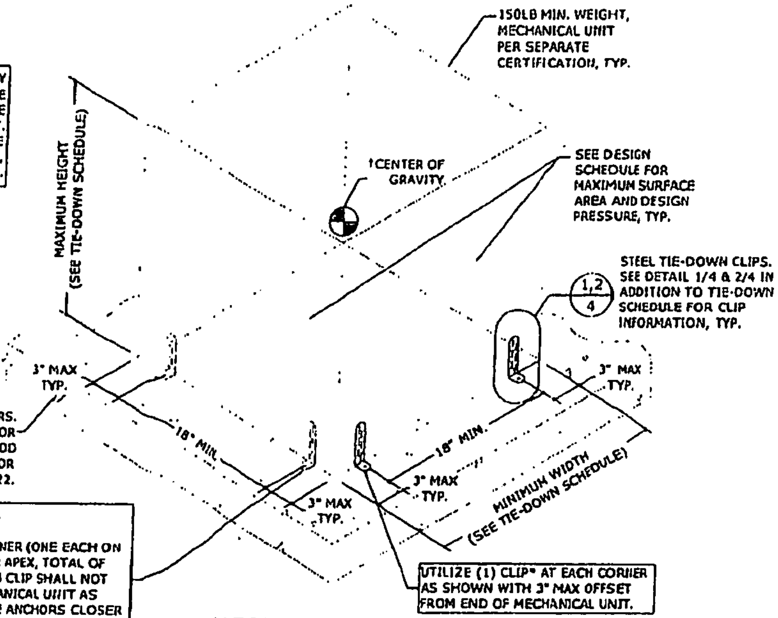
MECHANICAL UNIT STEEL TIE-DOWN CLIP CAPACITIES: AT GRADE & ROOF-TOP MOUNTED APPLICATIONS

†CENTER OF GRAVITY ASSUMED TO ACT AT THE GEOMETRIC CENTER OF THE MECHANICAL UNIT. MECHANICAL UNIT MUST BE SQUARE OR RECTANGULAR, NO IRREGULAR SHAPES.



HOST STRUCTURE DESIGN BY OTHERS. SEE TIE-DOWN SCHEDULES FOR ALLOWABLE SUBSTRATES. NOTE: WOOD MEMBERS MAY NOT BE USED FOR ROOF-TOP APPLICATIONS PER FBC 1522.

DOUBLE CLIP OPTION:

(2) TOTAL CLIPS MAY BE USED AT EACH CORNER (ONE EACH ON OPPOSING CORNER FACES, 3" FROM CORNER APEX, TOTAL OF (8) CLIPS PER UNIT FOR THIS OPTION). EACH CLIP SHALL NOT EXCEED 3" MAX OFFSET FROM END OF MECHANICAL UNIT AS DETAILED HEREIN. DO NOT SPACE CONCRETE ANCHORS CLOSER THAN THE ALLOWED SPACING LISTED IN THE TIE-DOWN ANCHOR SCHEDULES. SEE SHEETS 2&3 FOR MORE INFORMATION.

1/1 MECHANICAL UNIT TIE-DOWN ISOMETRIC

1" = 1'-0" ISOMETRIC

*FOR CLARITY, THIS ISOMETRIC ONLY SHOWS 1" CLIPS. THE ISOMETRIC LAYOUT IS TYPICAL FOR BOTH 1" AND 2" CLIP APPLICATIONS. 2" CLIPS ARE NOT CERTIFIED FOR ANCHORAGE TO CONCRETE.

TIE-DOWN CLIP DIRECTIVE EXAMPLE

(THE FOLLOWING EXAMPLE ILLUSTRATES THE PROCEDURE USED TO DETERMINE THE MAXIMUM ALLOWABLE WIND PRESSURE FOR ANY GIVEN MECHANICAL UNIT THAT CONFORMS TO THE DIMENSION RESTRICTIONS LISTED HEREIN. SEE SHEETS 2&3 FOR TIE-DOWN SCHEDULES.)

MECHANICAL UNIT CRITERIA:

CONSIDER THE INSTALLATION OF (1) MECHANICAL UNIT WITH THE FOLLOWING CRITERIA=
36" TALL x 36" DEEP x 24" WIDE, 150 LB WEIGHT AS VERIFIED BY OTHERS, INSTALLED TO 3192 KSI MIN. CONCRETE AT GRADE AS VERIFIED BY OTHERS.

PROCEDURE:

	PROCEDURE STEP	RESULT
1	LOCATE THE AT GRADE TIE-DOWN SCHEDULE ON SHEET 2 AND SELECT CLIP TYPE	CONSIDER 1" STEEL CLIP
2	DETERMINE LARGEST FACE AREA OF MECHANICAL UNIT TO BE INSTALLED	36"x36"=9FT²
3	CHECK MAXIMUM UNIT HEIGHT RESTRICTION	UNIT HEIGHT IS 36" WHICH IS LESS THAN THE MAXIMUM ALLOWABLE HEIGHT OF 48"
4	CHECK MINIMUM UNIT WIDTH RESTRICTION	UNIT WIDTH IS 24" WHICH IS EQUIVALENT TO THE MINIMUM ALLOWABLE WIDTH OF 24"
5	DETERMINE THE NUMBER OF CLIPS TO BE USED AT EACH CORNER OF THE MECHANICAL UNIT	CONSIDER (1) CLIP AT EACH CORNER, INSTALLED TO CONCRETE SUBSTRATE

CONCLUSION: MAXIMUM ALLOWABLE LATERAL DESIGN PRESSURE= 40PSF

(COMPARE THIS VALUE TO THE SEPARATE SITE SPECIFIC REQUIRED DESIGN WIND PRESSURE PROVIDED BY A LICENSED ENGINEER OR REGISTERED ARCHITECT; NOT INCLUDED IN THIS CERTIFICATION)
